Ecological and economical road rehabilitation in Bersenbrück

as the design is jointless. Together with the effective protection of the road edges against edge chipping, it thus saves on repair and maintenance costs. The ecological benefits: the open-pored concrete binds fine dust and pollutants from the road traffic and thus serves as a filter for pollutants. The process thus has a sustainable positive effect on the environment and improves the CO₂ balance. It also conserves resources, as the building material is recyclable.

The installation thickness and building material properties allow for adapt individually to the traffic load and the conditions on site. Because of the work, which the client had planned to carry out in November/December, was made more difficult by the weather. It was also necessary to modify the mould of the slipform paver and to change the scanning technology. Despite the challenges, the task was completed safely and successfully thanks to a high level of expertise.

Building materials expertise and safe execution from a single source

Thanks to the intensive collaboration with the in-house building materials laboratory, which also took over the on-site supervision, the executing construction site team handed over the project with high quality and free of defects to the satisfied client.
